ABSTRACT

In today’s era, so many websites and applications are created to help people to solve problems quickly, and also to make a lot of money, such as online merchandising websites, social networking websites, internet banking applications, apps that sell shuttle service, and so forth. Websites that are often used to date are, Google, Youtube, and Facebook, until finally, the creators of the website also launched a version of the application that can be used in gadgets with a similar appearance on the original website.

However, who would have thought, websites and applications could also have a negative impact, such as websites and applications specifically for adults, fraud, gambling, and so on.

To overcome these problems, we need a system that can limit the use of websites and applications known as Application Control. Application Control has the ability to limit the use of the website as well as the application so that users can monitor the website and whatever applications are accessed by the user.
