This study aims to determine the effect of the board structure on company performance. This study has six independent variables that consisted of size of the board of directors, independent directors, board of director’s meetings, board of director’s education, female directors, and managerial ownership.

This quantitative research used purposive sampling method. The sample of this study is 473 listed companies in the Indonesia Stock Exchange in the period of 2014 - 2018. The data were obtained from the website www.idx.co.id and the company's website. Hypotheses were tested by panel regression methods.

This study concludes that all the independent variables have no significant effect on company performance. Control variable consist of sales growth and market value has positive significant effect on corporate performance. The size of the board of directors still needs to be controlled to achieve good performance. Independent directors rarely interfere on other director decision. Board of director’s meetings only incurs unnecessary expenses. Board of director’s education is just a qualification. Women's board of directors in each country could have difference effect because of cultural differences. There are still many directors in public companies that do not have ownership in the company, so there is still no visible effect on managerial ownership.
