The cashiering system is a systemic program used to assist in the business transaction process. The main function of it includes aiding in sales process in a company which can help to check the stock availability, price of the items as well as generating the sales report.

Toko Pioner is currently still using the manual way in keeping the sales book and manually recording the stock ins and outs, which is inefficient and unstructured and this calls out to a cashiering system that can turn the above-mentioned processes into automated ones. This cashiering system is desktop based, which was compiled using C# and MySQL, will enable the users to effectively manage the inventory. This is to smoothen and reduce the time taken for the processes that the staff has to handle.

Keywords : *Toko Pioner, Cashier System, Desktop*
