ABSTRACT

The mission of this research is to diagnose whether the influence of enterprise risk management and firm characteristics on firm performance. The independent variable used in this study is enterprise risk management, profitability, firm size, leverage, sales growth. The dependent variable is the firm's performance which is measured using ROA (profitability).

To diagnose this research applies purposive sampling method which means that data is obtained from the financial statements of companies listed on the Indonesia Stock Exchange. Researchers used 1968 data that became a reference in producing this research. This study uses the SPSS version 22 and Eviews 10 systems.

The results of this study indicate that enterprise risk management, profitability, leverage have an insignificant effect on firm performance, while firm size and sales growth have a significant positive influence on firm performance.
