ABSTRACT

Practical work activities are carried out to assist MSMEs (Small and Medium Enterprises) starting from recording every transaction that occurs to making computerized financial statements. These practical work activities are carried out at YY Boutique Store. YY Boutique shop is a business that sells a variety of women's clothing. The system used in stores is still manual, which uses a notebook to record every sales transaction and keep a memorandum for every purchase. Therefore, internship report is intended to create a practical system for use by SME owners.

The implementation method for internship report activities is to conduct surveys and interview sessions. There are several stages in the implementation of activities, one of which is the implementation stage. The system design is carried out at that stage by using the 2013 version of Microsoft Access. The system is made according to SAK-EMKM regulations by adjusting store needs. The final stage in project implementation is assessment and reporting.

The output obtained from the implementation of activities is a Microsoft Access-based accounting system. The system provided at the store has been tested and improved so that the resulting system is reliable. The resulting system is expected to help stores in developing business and decision making related to store continuity.
